1. Partial fitness function technical details

Algorithm 1 and Algorithm 2 show the partial fitness function calculation after node addition and removal, respectively.

Algorithm 1 Function RecalcNodeAdded

```
1: Input: S: solution; G = (V, Ef_1, f_2): problem instance; v: node to
    add; viol: number of nodes that have zero neighbors in S; objValue:
    objective function value of the solution S; external: list of sorted (by
    edge weights) sets of external edges w.r.t. S.
 2: viol_{new} \leftarrow viol
 3: objValue_{new} \leftarrow objValue + f_1(v)
                                                // add node weight
                                    //v had a neighbor in S
 4: if external[v] \neq \emptyset then
        objValue_{new} \leftarrow objValue_{new} - f_2(external[v][0])
 6: end if
 7: for e \in external[v] do
                                      // add internal weights
        objValue_{new} \leftarrow objValue_{new} + f_2(e)
 9: end for
10: for e = (v, v') \in external[v] do
11:
        weight \leftarrow f_2(e)
        if external[v'] \neq \emptyset then
12:
            viol_{new} \leftarrow viol_{new} - 1
13:
            if v' \notin S then
                                // internal already added, add only external
14:
                objValue_{new} \leftarrow objValue_{new} + weight
15:
            end if
16:
17:
        else
            prev_{min\_weight} \leftarrow f_2(external[v'][0])
18:
            if v' \notin S and prev_{min\_weight} < weight then
                                                                        //v is (v')'s
19:
    new nearest neighbor in S
                objValue_{new} \leftarrow objValue_{new} - prev_{min\_weight} + weight
20:
21:
            end if
        end if
22:
23: end for
24: Output: viol_{new} + \frac{objValue_{new}}{W_{tot}+1}
```

Algorithm 2 Function RecalcNodeRemoved

```
1: Input: S: solution; G = (V, E, f_1, f_2): problem instance; v: node to
   remove; viol: number of nodes that have zero neighbors in S; objValue:
   objective function value of S; external: list of sorted (by edge weights)
   sets of external edges.
 2: viol_{new} \leftarrow viol
 3: objValue_{new} \leftarrow objValue - f_1(v) // subtract node weight
 4: if external[v] \neq \emptyset then
                                        // if node had a neighbor in S, add its
    external edge weight
        objValue_{new} \leftarrow objValue_{new} + f_2(external[v][0])
 6: end if
 7: for e \in external[v] do
                                      // subtract internal edge weights
        objValue_{new} \leftarrow objValue_{new} - f_2(edge)
10: for e = (v, v') \in external[v] do
        weight \leftarrow f_2(e)
11:
        if |external[v']| = 1 then
                                             // set cardinality is 1
12:
13:
            viol_{new} \leftarrow viol_{new} + 1
           if v' \notin s then
                                     // internal edge weights are already sub-
14:
    tracted, now subtract only external
               objValue_{new} \leftarrow objValue_{new} - weight
15:
16:
            end if

3. Additional statistical analysis and discussion

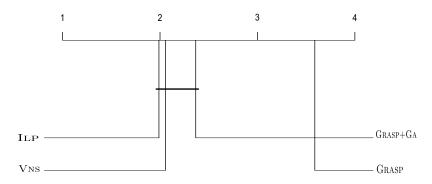

Figure 1: CD plot for the results of the instances from AMS-125.

By Figure 1 a statistical analysis for the four approaches on benchmark set AMS-125 is given by means of a CD plot. One could see that ILP and VNS are best according to the ranking and much better than VNS. However, the statistical difference between these three approaches is not statistical in terms of solution quality. Significant difference exists between them and the GRASP approach.

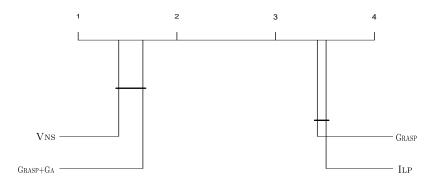

Figure 2: CD plot for the results of the instances from New-250.

Statistical comparisons w.r.t. solution quality of the four algorithms is shown in Figure 2. We conclude that the results of VNS and GRASP+VNS are significantly better than the results of the other two competitors. Average rankings of the results of VNS are better than that of the GRASP+VNS. However, difference is not significant.

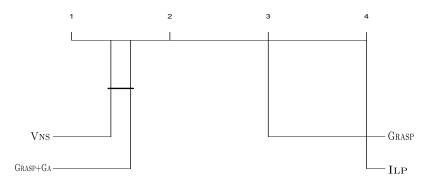

Figure 3: CD plot for the results of the instances from New-500.

Statistical comparison of the four approaches by means of a CD plot is shown in Figure 3. One can see that VNS and GRASP+GA delivers statistically better results than the other two competitors. Although the average ranking is in favour of VNS, there is no statistical difference between the results of this approach and GRASP+GA.

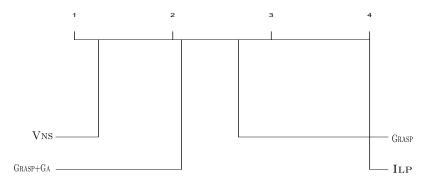

Figure 4: CD plot for the results of the instances from New-1000.

Statistical comparison of the four approaches on the 45 instances is presented by means of a CD plot given by Figure 4. One can see that the differences between the results delivered by VNS and GRASP+GA are statistically significant in favour of VNS approach.
